Zur Verbreitung von *Pleurodeles waltl* in Nord-Portugal

RUDOLF MALKMUS

(Schulstraße 4, D-97859 Wiesthal)

On the distribution of *Pleurodeles waltl* in northern Portugal

In northern Portugal (north of the Douro river) *Pleurodeles waltl* is distributed very rarely: only ten localities are known. Five of them were registrated between 1886 and 1911, and in the last 20 years only one of them could be verified. In this period six small populations were found, two in the costal region, the others in the eastern part. Their habitats are described in detail. In the norhernmost portuguese habitat (mines of Guadramil) *P. waltl* reaches the maximum of its vertical distribution (800 m asl) in Portugal.

Key words: Amphibia, Urodela, Salamandridae, *Pleurodeles waltl*, distribution, northern Portugal.

Der die Iberische Halbinsel und das nordwestliche Marokko bewohnende Rippenmolch ist in Portugal weit verbreitet (CRESPO & OLIVEIRA 1989, MALKMUS 1995, BONS & GENIEZ 1996, PLEGUEZUELOS 1997, SALVADOR & GARCIA-PARIS 1999). Als wärmeliebendes Faunenelement bevorzugt er tiefere Lagen und das Hügelland (< 500 m); im
